

APPENDIX A-135

REQUESTER CODES

1. Number of characters: Five.
2. Type of code: Alphabetic, Numeric, or Alpha/Numeric.
3. Explanation: This code is DSC structured and is used to provide each individual within the DSC jurisdiction a unique code for personal identification. This code is applied to each line of input related to Interrogation Requests directed to the Catalog Files and Item Management Coding History (IMCH) File. This code is also a required entry in Catalog Action Request (CAR) inputs (identified as Originator's Code).

a. The code is structured so that each position (left to right) is significant and represents a level of organizational structure. Computer output products (listings) generated as a result of inputs cited above are printed in Requester/Originator Code sequence. Distribution of these products from ODS and then through descending levels of organization to the individual (Requester/Originator) is based upon the structure of this code.

b. Special Requester's Codes are used in the control of special interrogations. These codes are established in policy table number 70 of the DTO. Other special Requester's Codes are used by the system to direct mechanically generated interrogation replies to the applicable operating element; e.g., DISTN (Distribution), PROVN (Provisioning, see appendix E-216 P for application) and LOGTR (Log Transfer). These special codes do not affect the assignment of Requester's Codes to Directorates/offices/individuals except that codes structured in accordance with this appendix should not repeat or conflict with special codes cited above.

<u>POSITION</u>	<u>CODE</u>	<u>DEFINITION</u>
1	0	The highest (first) level of identification. This is the first distribution indicator of any report or group of reports for the DSO.
2	M	The second level of identification. Second distribution indicator is for the MSO, DSO.
3	M	The third level of identification. Third distribution indicator is for the branch or section.
4-5	BR	Positions four and five represent the last level of identification (specific individual) and the last level of distribution which, normally, in the DSO should be the ORC of the submitter; e.g., John Smith (OMMBR), MSO, DSO.
